A C-clamp was then anchored to a table-top, and a long pole was attached vertically. A pulley sensor (for lack of better words) was clamped on the top of the pole. This sensor measures the angular acceleration by plugging the data it finds into an Angular Velocity vs. Time graph on DataStudio.

Mesons are intermediate mass particles which are made up of a quark-antiquark pair. Three quark combinations are called baryons. Mesons are bosons, while the baryons are fermions.. 1* The neutral Kaons K^0_S and K^0_L represent symmetric and antisymmetric mixtures of the quark combinations down-antistrange and antidown-strange.. 2* The neutral eta meson is considered to be a quark combination

(C) L (D) Ltan (A) Lsin (Fsin)(L) = FLsin To get the same torque with F applied perpendicular we would have to change the L to get $F(L\sin) \cos 60^\circ = 1/2$. A rod of length L and of negligible mass is pivoted at a point that is off-center with lengths shown in the figure below. The figures show two cases in which masses are suspended from the ends

Problem Giancoli 35-44 (II) Missing orders occur for a diffraction grating when a diffraction minimum coincides with an interference maximum. Let D be the width of each slit and d the separation of slits. (a) Show that if $d = 2D$, all even orders ($m = 2; 4; 6; \dots$) are missing. (b) Show there will be missing orders whenever $d = m_1 D = m_2 D$

The equation $2\pi\sqrt{l/g}$ gives the Period of oscillation of the pendulum about a fixed point (Giancoli, 2016). The experiment is done with a string whose one end is attached to the plumb bob and the other end allowed to oscillate about a point O. The bob has a mass M acting from its center of gravity.
