Skin And Its Appendages Study The skin is the largest organ of the body, covering an area of approximately 2 m². The skin is composed of the cutis (including the dermis and epidermis), subcutaneous tissue, and skin appendages. The epidermis, which is derived from ectoderm, is the outermost layer of the skin and is mainly composed of keratinocytes. The dermis, which is derived from mesoderm, is located underneath the ... Flashcards and Study Sets |

Quizlet The skin appendages, such as hair follicles, sweat glands, and sebaceous glands, make the skin function well in touch, temperature sensation, excretion, perspiration, and thermoregulation. Although

most of the commercialized skin substitutes can promote wound healing well, it remains a challenge to regenerate skin with complete appendages (Figure 52.9) [42]. Skin

clinical study to find out the frequency and pattern of skin changes in pregnant women.

Methods: All consecutive pregnant women were included in the study. A clinical study of skin changes in pregnancy The skin and its accessory structures make up the integumentary system, which provides the body with overall protection. The skin is made of multiple layers of cells and tissues, which are held to underlying structures by connective tissue (Figure 1). The deeper layer of skin is well vascularized (has numerous blood vessels).
