Set 4.1, page 202 1 Both nullspace

vectors will be orthogonal to the

row space vector in R^3 . The column

space of A and the nullspace of A^T

are perpendicular lines in R^2

because $\text{rank} = 1$. 2 The nullspace

of a 3 by 2 matrix with rank 2 is Z

(only the zero vector because the 2

columns are independent). So $x \cdot n =$

0, and row space = R^2 . MANUAL

Algebra ... Linear algebra moves
steadily to n vectors in m -
dimensional space. We still want
combinations of the columns (in the
column space). We still get m
equations to produce b (one for
each row). Those equations may or
may not have a solution. They
always have a least-squares
solution. The interplay of columns
and rows is the heart of linear
