The Elisa Enzyme Linked  
Immunosorbent The enzyme-linked  
immunosorbent assay(ELISA)  
(/ɪˈlaɪzə/, /,iːˈlaɪzə/) is a commonly  
used analytical biochemistry assay,  
first described by Engvall and  
Perlmann in 1971.[1] The assay  
uses a solid-phase type of enzyme  
immunoassay(EIA) to detect the  
presence of a ligand(commonly a  
protein) in a liquid sample using  
antibodies directed against the  
protein to be measured. ELISA -  
Wikipedia The enzyme-linked  
immunosorbent assay (ELISA) is an  
immunological assay commonly  
used to measure antibodies,  
antigens, proteins and  
glycoproteins in biological samples.  
Some examples include: diagnosis

of HIV infection, pregnancy tests, and measurement of cytokines or soluble receptors in cell

supernatant or serum. Enzyme-linked immunosorbent assay

(ELISA) | British ... Enzyme-linked immunosorbent assay (ELISA)

utilizes an enzyme system to show specific combination of an antigen with its antibody. It is a method of quantifying an antigen immobilized on a solid surface. ELISA uses a specific antibody with a covalently coupled enzyme. The amount of antibody that binds the antigen is proportional to the amount of antigen present, which is determined by

spectrophotometrically measuring the conversion of a clear substance to a colored product by the coupled enzyme. Enzyme-linked

immunosorbent assay) is a plate-based assay technique designed for detecting and quantifying soluble substances such as peptides, proteins, antibodies, and hormones. Other names, such as enzyme immunoassay (EIA), are also used to describe the same technology. Overview of ELISA | Thermo Fisher Scientific - US We use enzyme-linked immunosorbent assays (ELISA) to detect and quantify the presence of antibodies and proteins in patient blood samples by exploiting the interaction between antigen and antibody. ELISA is an established diagnostic testing technique that is known for its sensitivity, reproducibility, rapid procedure, and high throughput. Technologies:
